PREFACE

This report presents the final tabulation of statistical data relating to vital events in Missouri during 1995. Data for the year of the report was accepted through April 19, 1996, allowing information reflecting events in 1995 to be as complete as possible.

Missouri Vital Statistics 1995 is published for use in public health and related fields as an aid for studying births, deaths, fetal deaths, marriages, dissolutions, and abortions. Provisional vital statistics data are available through the publication, Missouri Monthly Vital Statistics. Unpublished detailed annual vital statistics data are available upon request.

TABLE OF CONTENTS

Table/G	raph	BIRTH AND DEATH TRENDS	Page
	Α	Live Birth and Death Rates per 1,000 Population: Missouri 1911-1995	1
1		Population, Recorded Births and Deaths with Rates per 1,000 Population and Natural Increase: Missouri 1911-1944	2
2		Population, Recorded and Resident Births and Deaths with Rates per 1,000 Population and Natural Increase: Missouri 1945-1995	2
	В	Tçtal Fertility Rates: Missouri 1911-1995	4
3		Fertility Rates per 1,000 Females by Age of Mother: Missouri 1911-1995	5
	С	Crude and Age-Adjusted Death Rates per 1,000 Population: Missouri 1911-1995	6
4		Age-Specific Death Rates per 1,000 Population: Missouri 1911-1995	7
		BIRTHS	
5 A		Resident Live Births by Selected Characteristics by Race of Mother: Missouri 1995	8
5B		Resident Live Births by Selected Obstetric and Pediatric Conditions and Procedures: Missouri 1995	9
6		Resident Live Births by Age of Mother by Live Birth Order by Mother's Marital Status by Race of Mother: Missouri 1995	10
7		Teen-age Resident Live Births by Age of Mother by Live Birth Order by Mother's Marital Status by Race of Mother with Percentages: Missouri 1995	11
8		Percent Low Birth Weight and Resident Live Births by Birth Weight by Age of Mother by Race of Mother: Missouri 1995	12
9		Resident Live Births by Mother's Marital Status by Race with Percentages by County and Cities with 25,000 or More Population: Missouri 1995	13
10A		Resident Live Births by Selected Characteristics by Race of Mother, Regional Planning Commission: Missouri 1995	17
10B		Resident Live Births by Selected Characteristics by County: Missouri 1995	21
10C		Resident Live Births by Selected Characteristics by Cities with 25,000 or More Population: Missouri 1995	41
11		Resident Teen-age Pregnancies and Abortions by Selected Ages by County of Residence: Missouri 1995	45
		ABORTIONS	
	D	Resident Abortion Ratios per 1,000 Live Births: Missouri 1971-1995	47
12		Resident Abortions by Race, Age of Woman and Type of Procedure by Weeks of Gestation: Missouri 1995	48
13		Resident Abortions by Age. Marital Status, and Education, by Race: Missouri 1995	49

Table of Contents (continued)

Table/Grap	h	Page
14A	Resident Abortions and Ratios per 1,000 Live Births by County of Residence: Missouri 1995	50
14B	Resident Abortions and Ratios per 1,000 Live Births by Regional Planning Commission of Residence: Missouri 1995	51
15	Resident Abortions by Age and Marital Status of Woman: Missouri 1995	51
16	Resident Abortions by Number of Living Children and Number of Previous Abortions:	51
	NATURAL INCREASE	
17	Resident and Recorded Live Births, Deaths, and Natural Increase with Rates by Counties and Cities with 25,000 or More Population: Missouri 1995	52
18	Resident and Recorded Live Births and Deaths by Cities with 2,500-24,999 Population: Missouri 1995	56
	DEATHS	
19	Twelve Leading Causes of Death by Race with Percentages and with Rates per 100,000 for all Races, Resident Data: Missouri 1995	59
20	Five Leading Causes of Death for Selected Age Groups with Percentages, Resident Data: Missouri 1995	60
21	Resident Deaths, Age Groups by Race by Sex with Age-Specific Rates per 1,000 by Sex: Missouri 1995	61
22A	Resident Deaths, Age Groups by Selected Causes of Death: Missouri 1995	62
22B	Male Resident Deaths, Age Groups by Selected Causes of Death: Missouri 1995	64
22C	Female Resident Deaths, Age Groups by Selected Causes of Death: Missouri 1995	66
E	Infant Death Rates per 1,000 Live Births: Missouri 1911-1944 (Recorded), 1945-1995 (Resident)	68
23A	Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by County and Cities with 25,000 or More Population: Missouri 1995	69
23B	White Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by County and Cities with 25,000 or More Population: Missouri 1995	71
23C	Black Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by County and Cities with 25,000 or More Population: Missouri 1995	73
23D	Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by Regional Planning Commission with Rates per 1,000 Live Births: Missouri 1995	75
23E	White Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by Regional Planning Commission: Missouri 1995	76

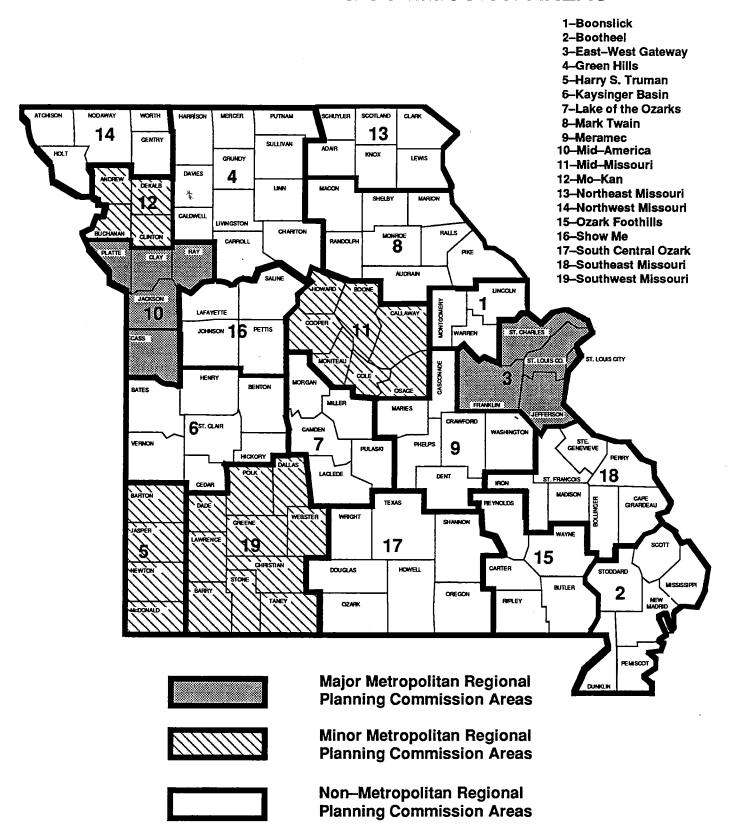

Table of Contents (continued)

Table/G	raph		Page
23F		Black Resident Perinatal, Infant, Fetal, Neonatal, Postneonatal and Maternal Deaths by Regional Planning Commission: Missouri 1995	77
24		Resident Infant Deaths by Age, Cause, and Race with Rates per 1,000 Live Births by Cause and Race: Missouri 1995	78
25		Resident Infant Deaths and Rates per 1,000 Live Births by Age of Mother by Birth Order: Missouri 1995	79
26		Resident Infant Deaths and Rates per 1,000 Live Births by Birth Weight by Race of Mother: Missouri 1995	79
27A		Resident Deaths by Selected Causes of Death; For State Total by Race with Rates per 100,000 for all Races; and for Regional Planning Commissions: Missouri 1995	80
2 7 B		Resident Deaths by Selected Causes of Death by County: Missouri 1995	83
27C		Resident Deaths by Selected Causes of Death by Cities with 25,000 or More Population: Missouri 1995	98
28		Recorded Deaths by Type of Accident, Age, and Sex: Missouri 1995	101
29		Abridged Life Table for the Total Population and by Sex: Missouri 1995	102
		MARRIAGES	
	F	Marriage Rates per 1,000 Population: Missouri 1949-1995	105
30		Reported Marriages by Age of Groom; by Age of Bride: Missouri 1995	106
31		Reported Marriages by Age and Previous Marital Status of Bride and Groom: Missouri 1995	108
32		Reported Marriages by Previous Marital Status of Bride and Groom: Missouri 1995	109
33		Reported Marriages by Race of Bride by Race of Groom: Missouri 1995	109
34		Reported Marriages by Month: Missouri 1995	109
35A		Reported Marriages by County of Recording with Rates per 1,000 Population: Missouri 1995	110
35B		Reported Marriages with Rates by Regional Planning Commission of Recording: Missouri 1995	111
		DISSOLUTIONS	
	G	Dissolution Rates per 1,000 Population: Missouri 1949-1995	112
36		Reported Dissolutions of Marriage by Month by Type of Decree: Missouri 1995	113
37		Reported Dissolutions and Annulments by Number of Previous Marriages, Husband by Wife: Missouri 1995	113
38		Reported Dissolutions and Annulments by Duration of Marriage: Missouri 1995	113

Table of Contents (continued)

Table/Graph		Page
39	Reported Dissolutions and Annulments by Number of Children Affected: Missouri 1995	114
40	Reported Dissolutions and Annulments by Petitioner by Disposition of Children and by Whether Child Support Awarded: Missouri 1995	114
41	Reported Dissolutions and Annulments by Age of Wife by Age of Husband: Missouri 1995	115
42	Reported Dissolutions and Annulments by Race, Wife by Husband: Missouri 1995	115
43A	Reported Dissolutions and Annulments by County of Recording with Rates per 1,000 Population: Missouri 1995	116
43B	Reported Dissolutions and Annulments with Rates by Regional Planning Commission of Recording: Missouri 1995	117

consistent with the National Center for Health Statistics (NCHS), which also implemented this change in 1989. Race of child had been computed by an algorithm based on race of mother and race of father. Persons of mixed parentage were classified according to the race of the nonwhite parent. Because of this rather arbitrary formula and the increasing proportion of out-of-wedlock births in which father's race is missing, it was decided by NCHS to implement this change to race of mother.

Appendix Table A below shows how this change affects infant death rates by race. Three sets of rates and ratios are presented. The first set shows the current method by race of mother and the second set shows the old method by race of child. Both of these use the 1989 death cohort, in which infant deaths occurring in 1989 are divided by births occurring in 1989. In fact, some of these births to 1989 infant deaths occurred in 1988. The third method using the birth cohort takes the births occurring in a given year (e.g., 1989) and matches any deaths that occur to them in the first year of life, even if they occurred in the following year, 1990. This is the preferred method, but takes longer to collect.

The infant death rates for blacks are consistently higher using race of mother than using race of child. The resulting black/white ratios are also consistently higher using race of mother. While the numerator (the number of black infant deaths) stays the same in both calculations, the denominator (the number of black live births) is lower by race of mother than by race of child. Comparing death cohort to birth cohort infant death rates and ratios by race of mother, differences are shown in both directions, ranging from 0.1 to 1.1 per 1000 live births.

In examining trends in infant death rates by race over time, it is important to use the same method throughout the time period compared. Therefore, it is not appropriate to compare black infant death rates by race of mother in 1989 to black infant death rates by race of child in 1988. The caveats relating to infant death rates by race over time also apply to other birth indicators such as low birth weight rates, out-of-wedlock teen birth rates, etc.

Appendix Table A Resident Infant Death Rates per 1000 Live Births by Race of Child, Race of Mother, Death Cohort vs. Birth Cohort: Missouri 1985-1995

BIRTH COHORT

DEATH COHORT

			DEATH		BINTITOONOM

TERMS "RESIDENT" AND "RECORDED"

It is important to understand the significance of the terms "Resident" and "Recorded" when analyzing vital statistics.

"Resident" data are compiled for vital events that relate to persons residing in an area independent of where the events occurred. (A person is considered to be a resident of an area if he has resided there six months or more. An exception to this involves people dying in hospitals, nursing homes, or other institutions. In such cases, the usual place of residence before admission is reported. In the case of live births, fetal deaths, and infant deaths, the residence of the mother is considered to be the residence of the child.)

"Recorded" data are based on the number of vital events that occur in an area. These data are used to analyze events that might be affected by the place in which they occur.

Resident and recorded figures can neither be added nor subtracted from the other. Thus the number of events occurring or not occurring in the same geographic area where the people reside cannot be calculated from resident and recorded data.

UNKNOWNS

Records classified as Missouri residents with unknown county of residence are included in the state totals of this publication. In annual vital statistics reports before 1979, these records were excluded from totals. The number of 1995 records with unknown county of residence by system is as follows:

Live Births	0
Fetal Deaths	0
Deaths	0
Abortions	99

The following imputations of unknowns were made in this report:

Unknown sex is considered male.
Unknown marital status is considered married.
Unknown live birth order is considered 1st.

RATES

Rates are calculated by dividing the event of concern by the population at risk or a related population and multiplying by a constant. Live birth, death, natural increase, marriage, and dissolution rates are expressed in terms of 1,000 estimated midyear population. Infant, perinatal, fetal, neonatal, and postneonatal death rates are stated per 1,000 live births.

Rates per 100 live births or percentages are used in Tables 7-10C for such rates as out-of-wedlock or low birth weight. In Table 10, unknowns are excluded in the calculation of percents when the percents are greater than 2 percent. These include: (1) crown heel less than 47 cm; (2) mother greater than 15 percent underweight; (3) mother greater than 20 percent overweight; (4) mother gained less than 15 pounds during pregnancy; (5) mother gained 45+ pounds during pregnancy; (6) inadequate prenatal care; (7) mother Medicaid participant; (8) mother WIC participant; (9) mother Medicaid and WIC; and (10) mother Food Stamp recipient. For less than 18 months since last birth, the denominator excludes first births. For weight gain during pregnancy the denominator is singleton births of 37 or more weeks of gestation.

Total Fertility Rate (Graph B) refers to the average number of births a woman would have if a given set of age-specific birth rates applied throughout her reproductive years.

General Fertility Rate (Table 3) refers to the total number of live births per 1,000 women aged 15-44 for a given year.

Age-Specific Fertility Rate (Table 3) is the number of live births born to mothers of a given age per 1,000 females of that age group for a given year.

The **Abortion Ratio** is a ratio of abortions per 1,000 live births for a given year.

Crude Death Rate is defined as the total number of deaths of area residents for the year divided by the midyear population of the area multiplied by some constant. The constants used in this report are 100,000 for cause specific rates and deaths for all causes in Tables 19 and 27A and 1,000 for death rates in all other tables and graphs.

Crude Death Rate = <u>number of deaths during year</u> x 1,000 or 100,000 midyear population

Age Specific Peath Rate (Tables 4 and 21) is calculated in the same manner as the crude death rate except that both the number of deaths and the midyear population are restricted to a given age group.

Age-Specific Death Rate =
For given age group:
number of deaths during year
midyear population

x 1,000

The **Age-Adjusted Death Rate** (Age-Adj Rate) is a weighted average of age-specific death rates. Comparison of areas or time periods using crude death rates can often be misleading, since these rates are affected by the age composition of the population. For example, a county may display a high crude death rate simply because it has an older population.

To control for these differences in age compositions, age-specific rates can be weighted according to a standard population. Such a calculation produces an age-adjusted rate. The age-adjusted rates shown in this report are calculated by the direct method with the following formula:

Age-Adjusted Death Rate = \sum Ma x \underline{Pa} P where Ma = age-specific rate for given age group Pa = standard population in given age group P = total standard population

This report uses five-year age groupings with the 1940 United States population as the standard. Each figure thus represents the rate that would have existed if the age-specific rates in question prevailed in a population whose age distribution is like that of United States in 1940. This serves to control for differences in age compositions and makes comparisons between areas or time periods more legitimate. It is important, however, not to compare age-adjusted death rates with other rates adjusted to different standard populations.

From 1972 to 1990, the Missouri 1970 population had been used as the standard in the Missouri annual vital statistics reports. This makes comparisons of age-adjusted death rates with annuals before 1991 impossible. The standard population was changed to United States 1940 to allow comparibility with national age-adjusted death rates published by the National Center for Health Statistics. The 1940 population is also used as the standard for age-adjusted death rates in the Year 2000 Goals and Objectives for both Missouri and the nation.

The **Abridged Life Tables** in this report (Table 29) are generated from a computer software package originally developed by the National Center for Health Statistics, and modified by the Missouri Center for Health Statistics. It uses the technique of "reference to a standard table." These tables are technically defined as "current life tables" since they are cross-sectional in nature. In other words, these tables do not represent the life expectancy of an actual cohort of all Missourians born in a particular year and followed throughout their lifetime. Rather, the current life table considers a hypothetical cohort and assumes it is

subject to the age-specific mortality rates existing for a given year. This means that the current life tables contained herein assume hypothetical cohorts subject throughout their lifetimes to the age-specific mortality rates prevailing for the year of this report.

The term "abridged" indicates that the age interval used in the tables are five-year age groupings rather than single years of age.

CAUSE OF DEATH CLASSIFICATION

Cause of death data are displayed by the underlying cause. The underlying cause of death is defined as the disease or injury which initiated the train of morbid events leading directly to death or the circumstances of the accident or violence which produced the fatal injury.

The causes of death presented here are classified in accordance with the Ninth Revision of the International Classification of Diseases (ICD-9), 1975; World Health Organization. This revision has been used to classify deaths occurring on or after January 1, 1979. Comparisons with data from earlier years must be done with caution, since these were classified under different coding schemes. Consequently, certain diseases may show changes in their trends as a result of changes in definitions. For a general measure of the extent of these changes between the eighth and ninth revisions, consult "Estimates of Selected Comparability Ratios Based on a Dual Coding of 1976 Death Certificates by the Eighth and Ninth Revisions of the International Classification of Diseases," *Monthly Vital Statistics Report*, National Center for Health Statistics, Volume 28, Number 11, Supplement (February 29, 1980).

The specific causes of death in this report are shown in groupings of 34 causes. In those tables presenting leading causes of death, the rankings are based on a further consolidation of these 34 causes. These causes are listed below with their ICD-9 codes. Those used for ranking purposes are noted with an asterisk.

Causes of Death	ICD-9 Codes
Tuberculosis *Septicemia* *AIDS*	038
*Syphilis	090-097
Residual of Infectious & Parasitic Diseases 001-009, 020-037, 039-041, 04	5-088, 098-139

** Only external cause of death codes (E-codes) are used on the death file for inuries.	

MEDICAL CONDITIONS ON BIRTH RECORDS

Table 5B presents selected medical conditions reported on the birth certificate by means of a check-off box system. Before 1989, medical conditions on the birth certificate were reported by open-ended questions. It is believed that the check-off box generally increases reporting. A study done by the Missouri Center for Health Statistics found that medical risk factors increased by 50 percent, labor or delivery complications by 30 percent, and congenital anomaly reporting nearly doubled in the first half of 1989 compared with 1988. See *Missouri Monthly Vital Statistics Report*, Nov. 1989, Vol. 23, No. 9 for more details.

ADDITIONAL DEFINITIONS

Apgar Score — An international code ranging from 0 to 10 used to measure the health of an infant at one minute and five minutes after birth. Items used to derive the score are heart rate, respiratory effort, muscle tone, reflex irritability and color. A score below eight implies a moderately or severely depressed condition. The score used in Table 10 is taken at five minutes after birth. Caution should be used in interpreting patterns of low Apgar scores by area because of a possible subjective bias in assigning scores. Different medical personnel may assign different scores to the same child.

Birth Order — Number of previous pregnancies plus one.

Crown Heel — Length of the baby at birth in centimeters.

Fetal Death — Death taking place at 20 weeks gestation or later and before birth.

GT 15 Percent Underweight/GT 20 Percent Overweight — If the mother's prepregnancy weight is greater than 15 percent below or 20 percent above the desired weight for her height according to the 1959 Metropolitan Life Insurance tables.

Inadequate Prenatal Care — Fewer than five prenatal visits for pregnancies less than 37 weeks, fewer than eight visits for pregnancies 37 weeks or longer or care beginning after the first four months of pregnancy. Before 1994, records with unknown month prenatal care began or unknown prenatal visits were excluded. Beginning in 1994, if adequacy of prenatal care could be determined even if month care began or visits were unknown, then these records were included.

Infant Death — Baby dying during the first year of life.

Infant Transfer — Infant transferred to another facility after delivery.

Less than 37 Weeks Gestation — Length of pregnancy less than 37 weeks based on date of last normal menses unless this calculation is less than 17 weeks, more than 44 weeks, unknown or if the birth weight and length of pregnancy were obviously inconsistent. This last criteria was added in 1994. In these cases of unknown or illogical length of pregnancy, the clinical estimate of gestation is used.

Live Birth Order — Number of previous babies born alive now living plus one.

Low Birth Weight — Less than 2500 grams or five and one-half pounds.

Maternal Death — Mother dying as a result of complications of pregnancy, childbirth and puerperium (ICD-9 codes 630-676).

Maternal Transfer — Mother transferred from another facility prior to delivery.

Natural Increase — Resident live births minus resident deaths.

Neonatal Death — Baby dying during first 27 days of life.

Out-of-Wedlock Birth — Birth involving mother who was unmarried at time of conception, at time of birth, and throughout time between conception and birth.

Perinatal Death — Fetal or neonatal death.

Postneonatal Death — Death occurring after 27th day of life and before one year.

Teen-age Pregnancy — Live birth, fetal death or abortion occurring to a woman under 20 years of age.
